

# Keeneland's Polytrack Maintenance Equipment

## Gallop Masters

A Gallop Master is used to condition or work the racetrack surface, providing the final finish for the surface before racing or training. It is equipped with depth adjusters fitted to either side of the tool frame. Rollers in front and back allow the Gallop Master to continuously level the surface. Tines, located between the sets of rollers eliminate the previous footprints, providing the finished surface. Gallop Masters come in varying widths to allow tractors to run in different paths on the track so they do not create areas of isolated compaction.

## Power Harrows

A Power Harrow is used to loosen the surface and maintain the pad depth. It is adjusted to be parallel to the surface. A roller on the back of the Power Harrow serves to re-pack the top portion of the surface back down after the pad is loosened to the proper depth.

## Rotovators

A Rotovator, very similar to a rototiller, is used to remix the surface and maintain the pad depth. The Rotovator also is equipped with a roller to begin compacting the top portion of the surface after remixing.

## Tractors

The tractors that Keeneland uses typically are between 90 to 120 HP and are four-wheel drive that feature low ground pressure tires to help reduce surface compaction.
